

New Type Brush "Curl It" - Dixon

second carbon

April 3, 1959

Moran Brush Manufacturing Col, Inc.
25 Manila
Hamden, Connecticut

Gentlemen:

We represent the inventor of a new type of hair brush which has many advantages over hair brushes now widely in use. This slit-bristled hair brush helps to curl the hair and to keep a curl in place, particularly with short hair. It is also a great help in training "stubborn" hair, both boys and girls; and its use creates a "pull" which stimulates the scalp and leads to better scalp health.

The manufacturing cost is no higher than that of any ordinary hair brush, the bristles may be made of any desired material, and the actual difference lies in the design of the bristles. Performance with this brush is so satisfactory that, once used, no other brush will be acceptable. A patent is pending in the United States Patent Office.

We shall be glad to provide complete details without obligation to interested manufacturers. Your comments and suggestions are invited and appreciated. In event this device is unsuited for your manufacture, perhaps you could suggest someone who would be better qualified for its submission, in which case we would be most grateful.

Cordially yours,
